

3 Signs 3I/ATLAS Might Be More Than Just a Comet

A recent reaction video from Charisma Media breaks down a revealing interview between Glenn Beck and Harvard astrophysicist Avi Loeb, focusing on the astonishing journey of the interstellar object 3I/ATLAS.

Described by Loeb as “no ordinary comet,” the object is hurtling through our solar system, triggering intense speculation about its origins and nature. The reaction video unpacks his arguments, examines the celestial context and raises the question: could this be an extraterrestrial probe rather than a natural phenomenon?

In the discussion, Loeb outlines three standout anomalies that, in his view, make 3I/ATLAS far more intriguing than a typical comet or asteroid. He emphasizes that these irregularities challenge conventional astronomical explanations and elevate the possibility of something rather extraordinary.

Below are the three key signs he lists:

- It is significantly larger than previous interstellar objects, its sheer size making a random natural origin unlikely.
- Its trajectory and path align almost perfectly within the plane of our solar system's planets—within just five

degrees—and its timing as it passes Mars, Venus and Jupiter suggests an intentional or highly improbable course.

- The object exhibits a reverse tail, with the gas and dust pointing toward the Sun rather than away from it, defying what astronomers expect from comets and hinting at an unnatural propulsion or composition.
