

Why You May Not Want to Eat McDonald's Ever Again

If you've ever found a somewhat crystallized, months-old fry on your car floor, you most likely know what's coming.

Multiply the fries with the rest of a McDonald's Happy Meal and add six more years, and you'll have the disgusting results of what one woman reported.

According to *Yahoo News*, Jennifer Lovdahl has kept a Happy Meal in her office for the last six years.

"[It] has not rotted, moulded, or decomposed at all!!! It smells only of cardboard. We did this experiment to show our patients how unhealthy this 'food' is. Especially for our growing children!!" she posted on Facebook.

The post is just further proof that fast, processed food doesn't belong in your body.
