

Dyson's New AI Toothbrush Scans Inside Your Mouth 28 Times a Second, But What Else Is It Tracking?

Artificial intelligence can now scan the inside of your mouth while you brush your teeth.

Dyson has launched the CameraJet, a £ AI-powered toothbrush equipped with a camera, Wi-Fi connectivity and an app. The device scans 28 live images per second to identify gaps between teeth before triggering a targeted jet of mouth rinse.

According to the Daily Mail, the toothbrush took 661 engineers six years to develop. Dyson claims it removes up to 69% more plaque than leading premium electric toothbrushes.

“Our research has shown that people consistently miss the areas where plaque forms: the gaps between teeth,” company founder Sir James Dyson said. “We wanted to solve three fundamental problems: how to see those gaps, remove plaque and how to improve cleaning performance while brushing.”

Users can watch a livestream from inside their mouths through the MyDyson app. The system also provides coverage maps, brushing insights and personalized feedback. RFID tags identify individual brush heads, track completed cleanings and alert users when replacements are needed.

Dyson presents these features as dental innovations. But the arrival of an internet-connected camera inside a toothbrush also raises serious privacy questions.

What information does the device collect? Are mouth images stored, transmitted or analyzed beyond the immediate cleaning session? Could dental patterns or other biological characteristics eventually be used to identify users, monitor their health or build increasingly detailed personal profiles?

The product illustrates how easily connected technology is moving into the most private areas of human life.

Millions have willingly submitted their DNA to commercial ancestry companies. Smart refrigerators can photograph and catalog their contents. Phones track locations, watches monitor heart rhythms and sleeping patterns, and home devices can see or hear what happens behind closed doors. Now AI can look inside the human mouth.

Each product may appear harmless when viewed alone. Together, however, they are constructing the technological foundation for a world in which nearly every action, movement and biological detail can be recorded.

Revelation 13 warns of a coming Beast System that will control economic participation and prevent people from buying or selling without its mark. Such control requires more than political power. It requires identification, surveillance and enforcement on an unprecedented scale.

The CameraJet is not the mark of the beast. But Christians should recognize the direction technology is moving and refuse to surrender discernment for convenience.

George Orwell's "1984" increasingly resembles a technological blueprint. Biblical prophecy goes further, warning that a system of worldwide control is coming. The disappearing boundary between public and private life may be preparing society to accept it without resistance – one convenient device at a time.
