

'Hobbit' Remains Found in Incredible Discovery

As it turns out, "The Lord of the Rings" just may have an even greater connection to reality than we ever thought.

In a report by Fox News, remains of an unusually small arm bone, jawbone and teeth were discovered in the Indonesian island of Flores, which is located near another site where 'hobbit' remains were unearthed two decades ago. These bones are believed to be 700,000 years old.

To pre-order L.A. Marzulli's "Rungs of Disclosure," visit .

At first, the bone of the arm was collected thinking it belonged to a crocodile as it only measured 3 and a half inches. However, it was later determined that it was the remains to a creature of human ancestry.

While the previous hobbit bones uncovered determined that the beings were about three and a half feet tall, these newly discovered bones are showing that some of these beings could have also been shorter, around 3-foot-3.

As the Associated Press noted, the first remains uncovered dated back from between 60,000 and 100,000 years ago.

These bones have left scientists stumped on where they first originated from.

“This question remains unanswered and will continue to be a focus of research for some time to come,” anthropologist Matt Tocheri told the AP.

This fascinating discovery is a reminder that God is mysterious and wonderful in everything He created, and that we have yet to even see the tip of all that He has done.
