

Jerusalem Post Reports: DNA Super Vaccines Are Here

The Jerusalem Post is reporting that a new type of vaccine against the coronavirus has just been created in India and is now approved for use. It is being described as a DNA vaccine, and it ushers the world into a new realm of medicine.

In order to help the general public understand what this new type of vaccine means to them, Tel Aviv University's professor Jonathan Gershoni describes it as a "software vaccine."

"You can have a hardware vaccine that consists of a killed virus for example, or an attenuated virus," he says. "Or you can have a subunit vaccine as well, such as the vaccine for Hepatitis B, which is just purified spike protein."

Those who created the vaccine hail it as a breakthrough.

Prime Minister Narendra Modi addressed the United Nations today and invited vaccine manufacturers, "Come, make vaccine in India," reports.

"Despite limited resources, India—which believes in the philosophy of 'Seva Param Dharam' (service is the highest religion)—is completely invested in the development and manufacture of the vaccines," the prime minister continued.

Many of those who are hesitant to receive the vaccine have expressed concerns over how the vaccine will affect their DNA.
