

‘The Future is Here’: Robots Make Stunning Strides in the Middle of War

Are robot warriors the future?

In a report by Fox News, it was noted that the Ukrainian President Volodymyr Zelenskyy let the world know that Ukraine made a stunning capture of a Russian position in a unique way: using robots.

“For the first time in the history of this war, Ukrainian warriors captured an enemy position using exclusively unmanned platforms and drones,” Zelenskyy stated. “The future is here, on the battlefield, and Ukraine is creating it.”

Fox also reported that Zelenskyy shared how these autonomous systems have “participated in over 22,000 frontline missions in just three months.”

When Machines Decide the Battlefield

If wars can now be fought—and even positions captured—without a single soldier physically present, it raises a sobering question: how might conflicts be started or escalated when human cost feels less immediate?

To order Amanda Grace’s new book, Brace For Impact, visit .

Decisions once slowed by the reality of human loss may be made faster, potentially leading to more frequent or prolonged conflicts. At the same time, these technologies could also be used to de-escalate, minimizing casualties and creating new pathways to end wars without the same level of devastation.

Yet the rise of robotic warfare also introduces a new kind of tension—one where control becomes increasingly complex. Who is ultimately responsible when machines make split-second decisions in combat? As artificial intelligence becomes more advanced, the line between human command and machine autonomy may blur, creating ethical dilemmas the world has never faced before.

Scripture points to a time when deception, power and control intensify on a global scale. As machines begin to carry out actions once reserved for people, it raises deeper spiritual questions about what may be happening next as we run full speed toward the end of time.
